Typical optical oscillators that require amplification and loss.
Amplification is provided by stimulated emission in a gain medium.

For simplicity consider the 2D model:

$$i\frac{\partial\psi}{\partial z} + \nabla^2\psi + N(|\psi|^2)\psi = 0$$

where  $\psi = \psi(x, y, z)$ ,  $\nabla^2 = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$ , and the function  $N(|\psi|^2)$ is an arbitrary function of the intensity  $|\psi|^2$ .

• Look for localized modes:  $\psi(x, y, z) = u(x, y)e^{i\mu z}$ ,  $\mu \in \mathbb{R}$ .

### Spectral Renormalization

- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode–locking equation
- Dispersion managed solitons
- Conclusions

This iteration is for n > 0. When n = 0 an initial guess is required, say a Gaussian or a sech x, that resembles the properties of the required solution.

When μ < 0 dividing by μ + |ω|<sup>2</sup> may result in zeros in the denominator thus causing the iterative scheme to fail to converge. To overcome this add and subtract the term rv(x) with r > 0 determining the renormalization constant λ is not affected and the iterative scheme becomes

$$\hat{v}_{n+1}(\boldsymbol{\omega}) = \frac{|\boldsymbol{\mu}| + r}{r + |\boldsymbol{\omega}|^2} \hat{v}_n - \frac{\mathcal{F}\{N(|\lambda_n v_n|^2)v_n\}}{r + |\boldsymbol{\omega}|^2}$$

- Nonvanishing boundary conditions
- The master equation
- The mode–locking equation
- Dispersion managed solitons
- Conclusions

This iteration is for n > 0. When n = 0 an initial guess is required, say a Gaussian or a sech x, that resembles the properties of the required solution.

• When  $\mu < 0$  dividing by  $\mu + |\omega|^2$  may result in zeros in the denominator thus causing the iterative scheme to fail to converge. To overcome this add and subtract the term rv(x) with r > 0 determining the renormalization constant  $\lambda$  is not affected and the iterative scheme becomes

$$\hat{v}_{n+1}(\boldsymbol{\omega}) = \frac{|\boldsymbol{\mu}| + r}{r + |\boldsymbol{\omega}|^2} \hat{v}_n - \frac{\mathcal{F}\{N(|\lambda_n v_n|^2)v_n\}}{r + |\boldsymbol{\omega}|^2}$$

### The method converges for arbitrary nonlinearities.

#### Contents

- Mode–locked lasers
- Ti:Sapphire laser

### Spectral Renormalization

- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode–locking equation
- Dispersion managed solitons
- Conclusions

This iteration is for n > 0. When n = 0 an initial guess is required, say a Gaussian or a sech x, that resembles the properties of the required solution.

• When  $\mu < 0$  dividing by  $\mu + |\omega|^2$  may result in zeros in the denominator thus causing the iterative scheme to fail to converge. To overcome this add and subtract the term rv(x) with r > 0 determining the renormalization constant  $\lambda$  is not affected and the iterative scheme becomes

$$\hat{v}_{n+1}(\boldsymbol{\omega}) = \frac{|\boldsymbol{\mu}| + r}{r + |\boldsymbol{\omega}|^2} \hat{v}_n - \frac{\mathcal{F}\{N(|\lambda_n v_n|^2)v_n\}}{r + |\boldsymbol{\omega}|^2}$$

- The method converges for arbitrary nonlinearities.
- So far, the method can only converge for the ground states. Higher modes can not be found.

Let us consider the NLS equation in the normal regime,

$$i\psi_z - \frac{1}{2}\psi_{tt} + |\psi|^2\psi = 0$$

We need to seek solutions of the form 
$$\psi(z,t) = u(t) \mathrm{e}^{i\mu z + i\phi(t)}$$

where u(t) and  $\phi(t)$  are now real functions of t. Separate real and imaginary parts to finally obtain for the amplitude

$$-\mu u - \frac{1}{2}u_{tt} + \frac{A^2}{2u^3} + u^3 = 0$$

where A is a constant.

Differentiate and set  $u_t = v$  to obtain the equation for v

$$-\mu v - \frac{1}{2}v_{tt} - \frac{3A^2}{2u^4}v + 3u^2v = 0$$

### The iteration scheme is

$$v = \lambda w, \quad u_n = \lambda_n \left( \int w_n \, \mathrm{d}t + u_\infty \right)$$
$$\int_{-\infty}^{+\infty} (-\mu + \omega^2) |\hat{w_n}|^2 \, \mathrm{d}\omega -$$
$$\int_{-\infty}^{+\infty} \mathcal{F} \left\{ \frac{3A^2}{2\lambda_n^4 u_n^4} w_n - 3\lambda_n^2 u_n^2 w_n \right\} \hat{w_n}^* \, \mathrm{d}\omega = 0$$
$$\hat{w_{n+1}} = \frac{\mu + r}{r + \omega^2/2} \hat{w_n} + \frac{\mathcal{F} \left\{ \frac{3A^2}{2\lambda^4 u_n^4} w_n - 3\lambda^2 u_n^2 w_n \right\}}{r + \omega^2/2}$$

# Haus was the first to derive this equation to model mode–locked lasers:

 $i\psi_z + (1 - i\tau g(z))\psi_{tt} + (4 - i\beta)|\psi|^2\psi + i(\gamma - g(z))\psi = 0$ 

where

$$g(z) = \frac{2g_0}{1 + \int_{-\infty}^{+\infty} |\psi|^2 \, \mathrm{d}t/e_0}$$

The dynamics, solutions and their stability crucially depend on the values of  $g_0$ ,  $e_0$ ,  $\gamma$  and  $\beta$ . A perturbative analysis and a special set of solutions for  $e_0 = \int_{-\infty}^{+\infty} |\psi|^2 dt$  was given by Kutz. Hereafter,  $e_0 = 1$ , and  $g_0 = \tau = \gamma = 0.1$  and we study the equation for the different values of  $\beta$ .

Using spectral renormalization we derive the following iteration scheme:

$$\hat{v}_{n+1} = \frac{\mathcal{F}\{-i\tau G_n v_{n,tt} + (4-i\beta)|\lambda_n v_n|^2 v_n - iG_n v_n\}}{\mu + \omega^2 - i\gamma}$$
$$\int_{-\infty}^{+\infty} (\mu + \omega^2 - i\gamma)|\hat{v}_n|^2 d\omega =$$
$$\int_{-\infty}^{+\infty} \mathcal{F}\{-i\tau G_n v_{n,tt} + (4-i\beta)|\lambda_n v_n|^2 v_n - iG_n v_n\}\hat{v}_n^* d\omega$$

### where

$$G_n = \frac{2g_0}{1 + \int_{-\infty}^{+\infty} |\lambda_n v_n|^2 \, \mathrm{d}t/e_0}$$

Modes, ie solutions to the equation are found for specific values of  $\mu$ .

Let us now consider the following model for the propagation of pulses in a laser cavity

$$i\psi_z + \frac{1}{2}\psi_{tt} + |\psi|^2\psi =$$

$$\frac{ig}{1 + \epsilon \int_{-\infty}^{+\infty} |\psi|^2 dt}\psi + \frac{i\tau}{1 + \gamma \int_{-\infty}^{+\infty} |\psi|^2 dt}\psi_{tt} - \frac{il}{1 + \delta|\psi|^2}\psi$$

where the parameters g,  $\tau$ , l,  $\epsilon$ ,  $\gamma$  and  $\delta$  are all positive, real constants. The first term on the right hand side represents saturable gain, the second is nonlinear filtering and the third saturable loss.

In our analysis we will fix  $\tau = l = 0.1$  and  $\epsilon = \gamma = \delta = 1$  and we will modify the gain parameter g.

### Denote

$$P(t) = \frac{ig}{1 + \epsilon \int_{-\infty}^{+\infty} |u|^2 \, \mathrm{d}t} u + \frac{i\tau}{1 + \gamma \int_{-\infty}^{+\infty} |u|^2 \, \mathrm{d}t} u_{tt} - \frac{il}{1 + \delta |u|^2} u.$$

Using spectral renormalization we derive the following iteration scheme:

$$\int_{-\infty}^{+\infty} (\mu + \omega^2/2) |\hat{v_n}|^2 \, \mathrm{d}\omega +$$
$$\int_{-\infty}^{+\infty} (\mathcal{F}\{P_n(\lambda, t) - |\lambda_n v_n|^2 v_n\}) \hat{v_n}^* \, \mathrm{d}\omega = 0$$
$$\hat{v}_{n+1} = -\frac{\mathcal{F}\{P_n(\lambda, t) - |\lambda_n v_n|^2 v_n\}}{\mu + \omega^2/2}$$

Again, modes, ie solutions to the equation are found for specific values of  $\mu$ .

The characteristics of an optical pulse propagating in a dispersion managed (DM) system under the effect of gain and loss can be described by the p–NLS equation

$$i\frac{\partial u}{\partial z} + \frac{d(z)}{2}\frac{\partial^2 u}{\partial t^2} + g(z)|u|^2 u = \frac{ig}{1 + \epsilon \int_{-\infty}^{+\infty} |u|^2 \, \mathrm{d}t}u + \frac{i\tau}{1 + \gamma \int_{-\infty}^{+\infty} |u|^2 \, \mathrm{d}t}u_{tt} - \frac{il}{1 + \delta |u|^2}u$$

where u = u(z, t), z, and t are the dimensionless variables which represent the complex envelope of the electrical field, longitudinal distance, and retarded time, respectively. The function d(z) is the local value of fiber dispersion and g(z)includes the effects of varying power resulting from fiber loss and periodic amplification. Both factors are real functions of zwith period  $z_a$ , which denotes the DM period and which is taken equal to the amplifier spacing.

- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode-locking equation
- Dispersion managed solitons
- Conclusions

#### **DMSNLS** soliton in Log scale

Contents

- Mode–locked lasers
- Ti:Sapphire laser
- Spectral Renormalization
- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode-locking equation
- Dispersion managed solitons
- Conclusions

Moderate dispersion management,  $s=1,\,g=0.3$  and  $\mu=1.7487$ 

### **DMSNLS** soliton in Log scale

Contents

- Mode–locked lasers
- Ti:Sapphire laser
- Spectral Renormalization
- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode–locking equation
- Dispersion managed solitons

Conclusions

Evolution of the pulse for s = 1, g = 0.3 and  $\mu = 1.7487$ 

Contents

- Mode–locked lasers
- Ti:Sapphire laser
- Spectral Renormalization
- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode–locking equation
- Dispersion managed solitons
- Conclusions

DMNLS equation is an asymptotic equation that reassembles the features of the constant dispersion NLS.

#### Contents

- Mode–locked lasers
- Ti:Sapphire laser
- Spectral Renormalization
- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode–locking equation
- Dispersion managed solitons
- Conclusions

DMNLS equation is an asymptotic equation that reassembles the features of the constant dispersion NLS.

Mode–locking occurs for a wider range of parameters.

#### Contents

- Mode–locked lasers
- Ti:Sapphire laser
- Spectral Renormalization
- Examples: Vanishing boundary conditions
- Nonvanishing boundary conditions
- The master equation
- The mode-locking equation
- Dispersion managed solitons

Conclusions

DMNLS equation is an asymptotic equation that reassembles the features of the constant dispersion NLS.

- Mode–locking occurs for a wider range of parameters.
- For strong dispersion maps, when the gain parameters increases the energy also increases so that the equation is approximate Hamiltonian. A wide range of µ's can support near modes.

- The master equation
- The mode-locking equation
- Dispersion managed solitons

Conclusions

We presented recent developments in the theory of mode–locked lasers. A new model equation is proposed for the study of these systems, that seems to be able to describe all their physical properties. A numerical method, the spectral renormalization, is used to find the solutions of this equation for both constant dispersion and dispersion managed solitons.
